

1.1.2 Area of Rectangle :

A) Algorithm Step

1. Start

Step 2. Read length (a) and width (b)

Step 3. Compute area = $a \times b$

Step 4. Display the area formatted to 2 decimal places

Step 5. Stop

B) Python Code

```
a=float(input())
```

```
b=float(input())
```

```
) area = a*b
```

```
print(f"{area:.2
```

```
f}")
```

C) output

The screenshot displays the CodeTANTRA IDE interface. On the left, the problem statement for "1.1.2. Area of Rectangle" is shown, including the formula $\text{Area of Rectangle} = \text{Length} \times \text{Width}$ and input/output format instructions. The main editor shows the following Python code:

```
1 a=float(input())
2 b=float(input())
3 area=a*b
4 print(f"{area:.2f}")
```

Below the code editor, the execution results are displayed. The average time is 0.004 s and the maximum time is 0.007 s. The output shows that 5 out of 5 shown test case(s) passed and 5 out of 5 hidden test case(s) passed. The test cases are as follows:

Test Case	Expected output	Actual output
Test case 1	18.5	18.5
Test case 2	54.68	54.68
