

EX 1.1.4) Area of Triangle

A) Algorithm :

Step 1. Start

Step 2. Read base (b) and height (h)

Step 3. Compute $\text{area} = 0.5 \times a \times b$

Step 4. Display/Print the area formatted to 2 decimal places

Step 5. Stop

B) Python Code :

```
a= float(input()) b=
float(input()) area
= (a*b)/2
print(f"{area:.2f}")
```

C) flowchart :

D) Output image:

1.1.4. Area of Triangle 11:25 🔍 🌙 🔗 🔖 ⋮

Write a Python program that prompts the user to enter the triangle's base and height and computes the triangle's area.

Formula: $Area\ of\ Triangle = 0.5 \times base \times height$.

Input Format:

- The first line of input is the float value that represents the base of the triangle.
- The second line of input is the float value that represents the height of the triangle.

Output Format:

- The output is the floating point value that represents the area of a triangle, formatted to two decimals.

triangleA.py Submit

```
1 a=float(input())
2 b=float(input())
3 area=a*b/2
4 print(f"area:.2f")
```
